

Airborne bacteria: names and numbers, please...

Runar Thyrhaug
Dep. of Biology
University of Bergen
Norway

runar.thyrhaug@bio.uib.no

My background

- Microbial ecology
- Marine microbiology group- Bergen, Norway
- Focus: algae, bacteria, protozoa, virus

My background

- Microbial ecology
- Marine microbiology group- Bergen, Norway
- Focus: algae, bacteria, protozooa, virus
- Methods
 - Nutrient uptake/turnover
 - Production rates
 - Genetic diversity/biodiversity
 - Viral activity
 - Modelling (vs experiments)

Why airborne bacteria?

- Curiosity...new field
- Biodiversity and transport rates
- Microbial production
- Improved/new methods...possibilities?

Bacteria in the air

....from where?

- Soil (terrestrial)
- Sea /fresh water

Bacteria

$\sim 10^9 \text{ g}^{-1}$

$\sim 10^6 \text{ mL}^{-1}$

Virus

??

$\sim 10^7 \text{ mL}^{-1}$

Bacteria in the air

....from where?

	<u>Bacteria</u>	<u>Virus</u>
■ Soil (terrestrial)	$\sim 10^9 \text{ g}^{-1}$??
■ Sea /fresh water	$\sim 10^6 \text{ mL}^{-1}$	$\sim 10^7 \text{ mL}^{-1}$

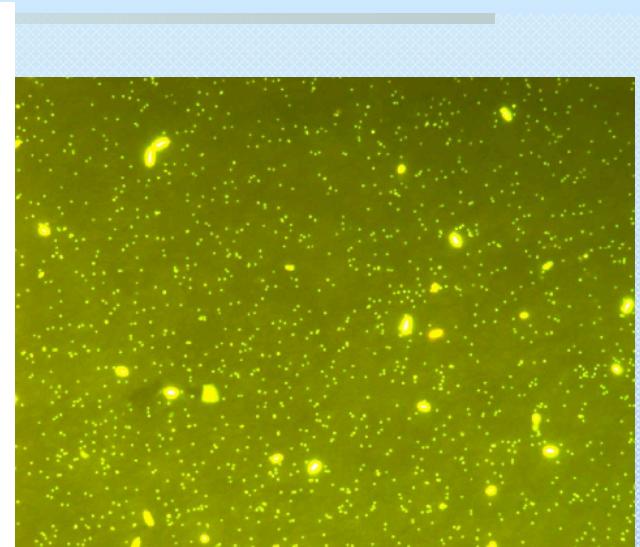

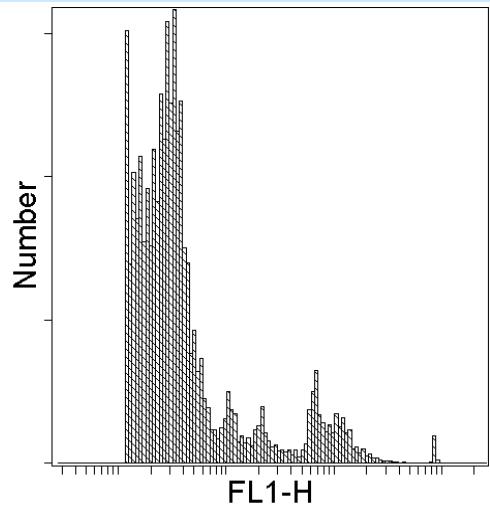

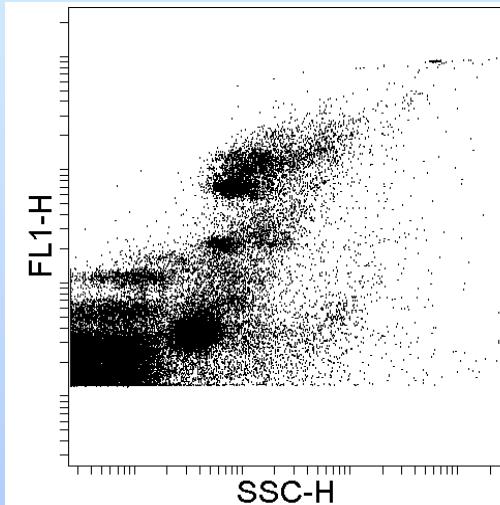

- We know:
- Most marine bacteria are assumed to be alive
- Nutrient limited N , P or C
- <1% growing on agar plates (sea water and soil samples!)

Counting airborne bacteria

- Liquid samples!
 - Rain or air sampled in liquids
- Methods:
 - Flow cytometry (FCM)
 - DNA/RNA staining - fluor /scatter signals from single particles
 - Quantitative PCR (Q-PCR)
 - DNA staining – amount of bacterial DNA in a bulk sample
 - Colony forming units (CFU)
 - Bacteria willing to grow on agar plates
 - Epifluorescence microscopy (EFM)
 - DNA/RNA staining - fluor signals from single particles

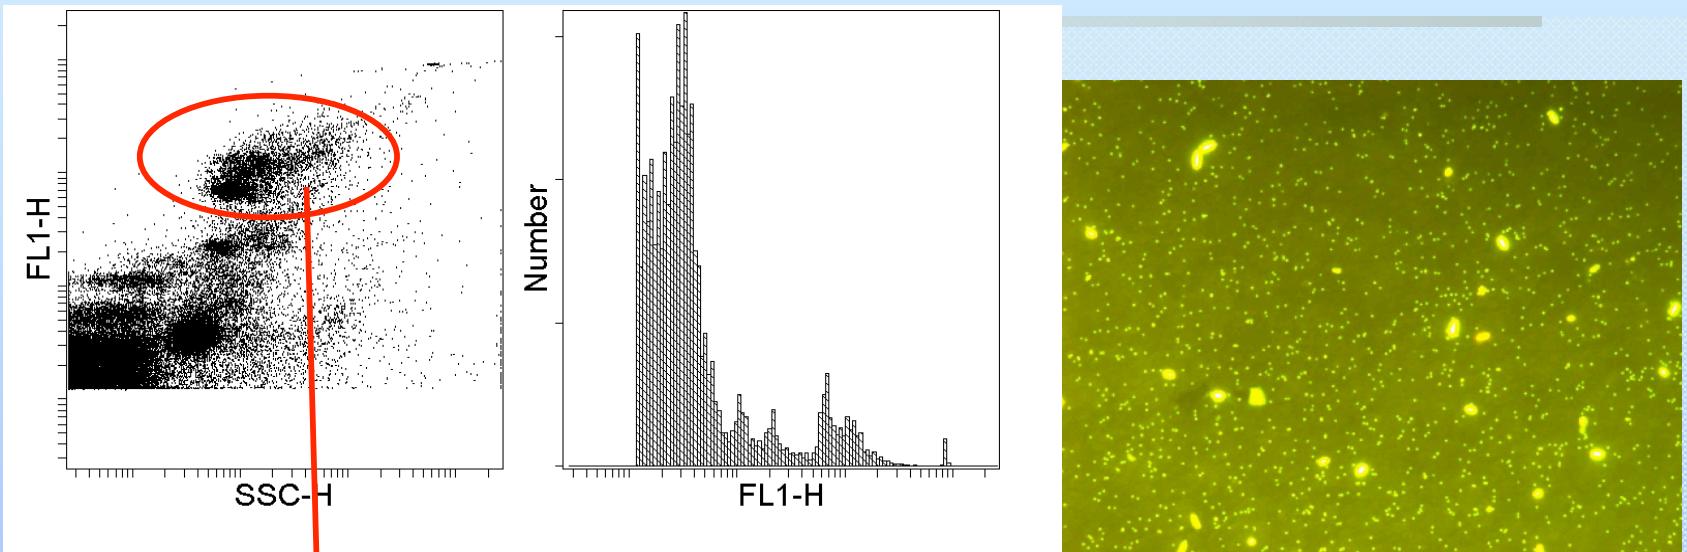

FCM plot / EFM picture

sea water examples:

FCM plot / EFM picture

Marine bacteria

FCM plot / EFM picture

sea water examples:

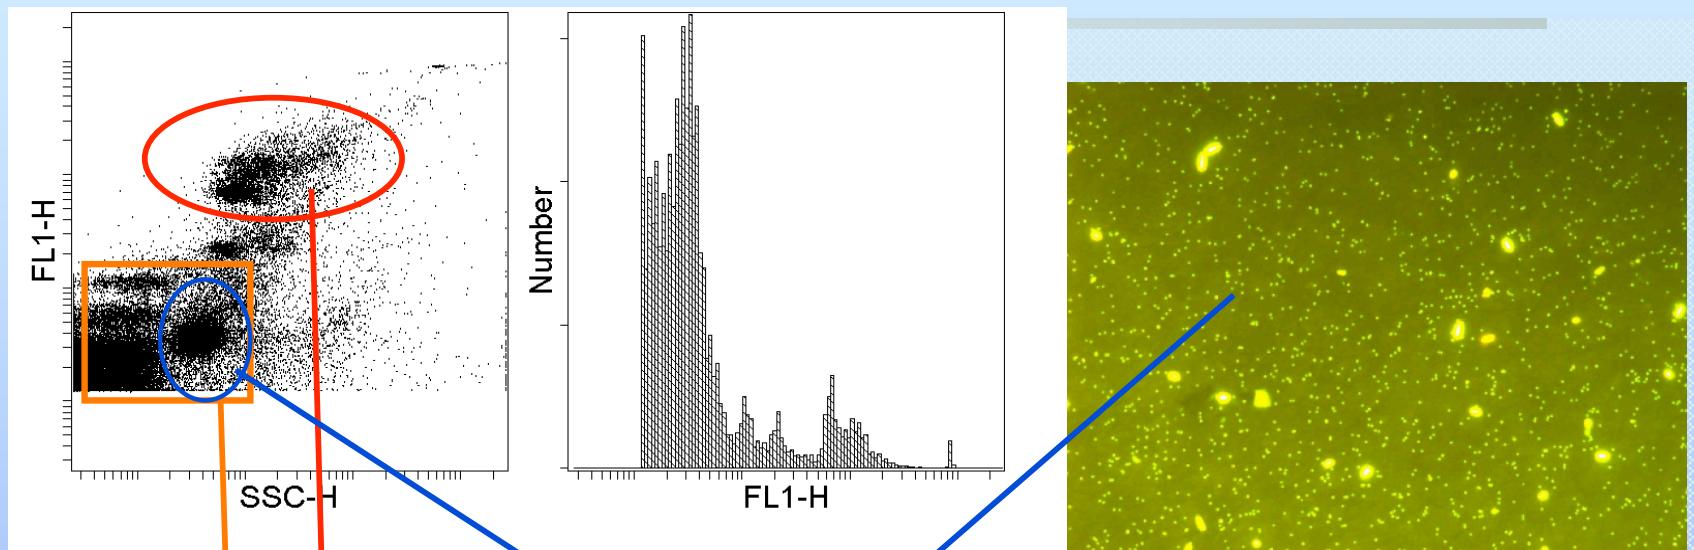

Marine bacteria

Marine viruses

FCM plot / EFM picture

sea water examples:

Marine bacteria
Marine viruses

EhV

Emiliania huxleyi virus
isolate (EhV)

Sampling airborne bacteria

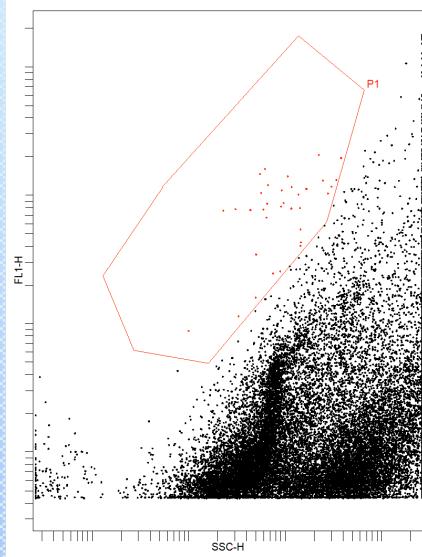

■ Xmx-cv (Dycor)

- $0,7 \text{ m}^3 \text{ min}^{-1}$
- 5 mL PBS
- Suggested max sampling time: 5 min
- Our max: 10 min

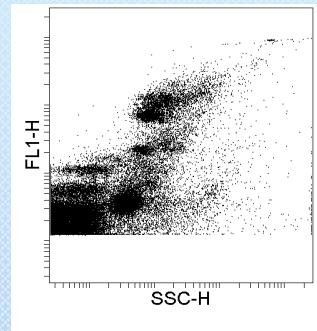

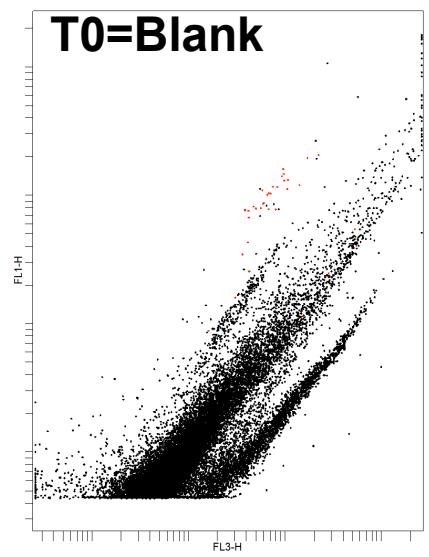

Flow cytometry of air samples

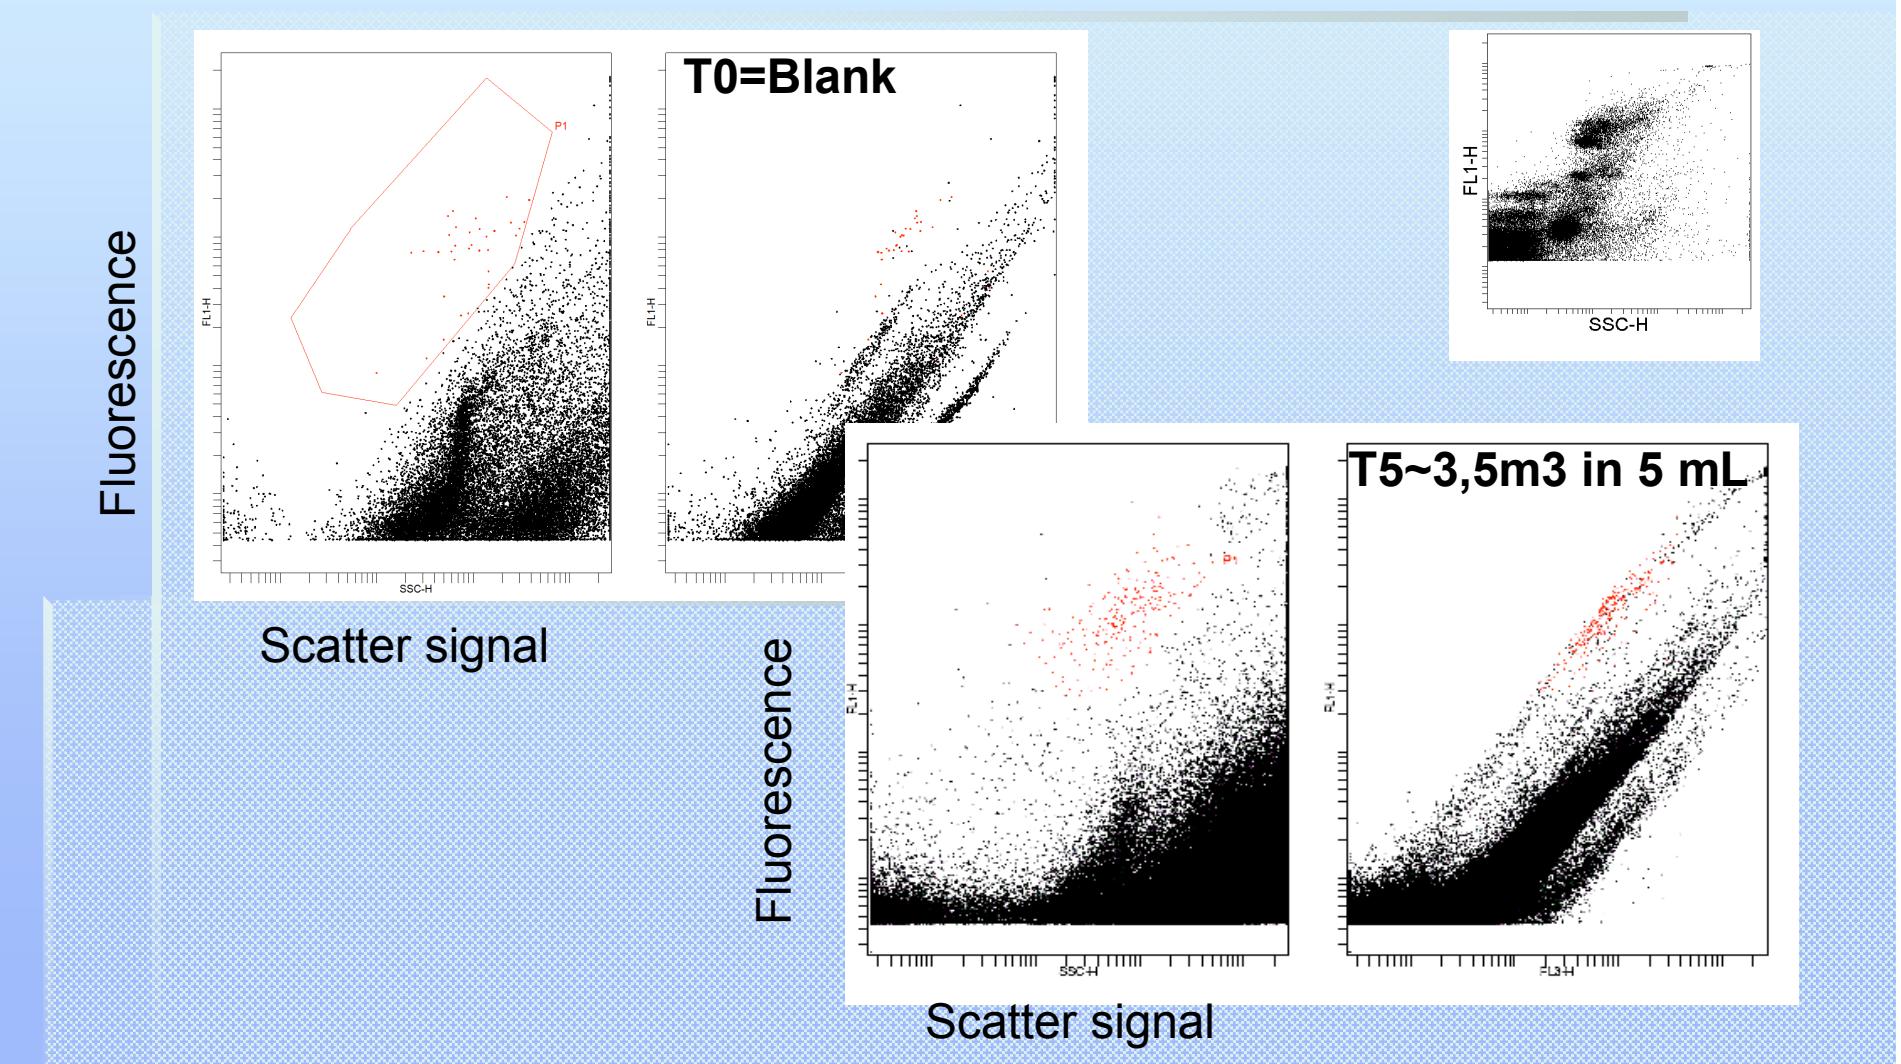

Fluorescence

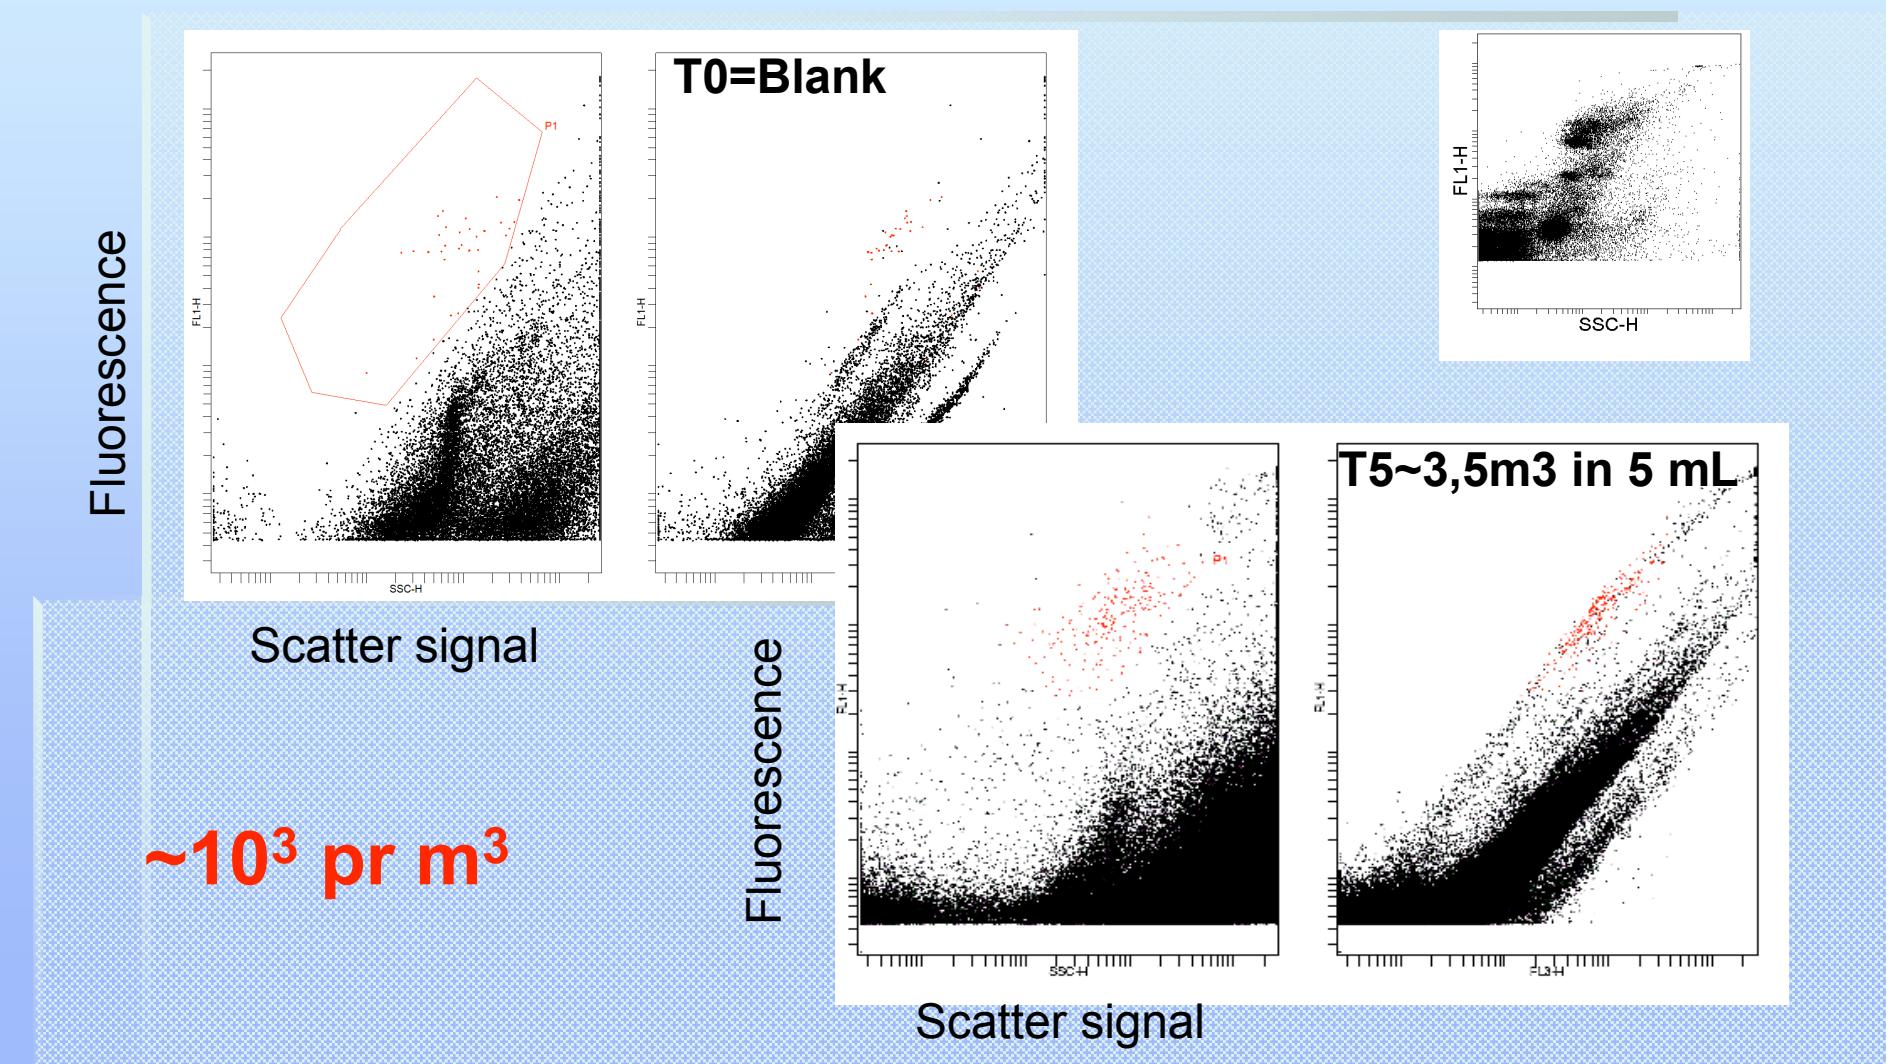

Scatter signal

Flow cytometry of air samples

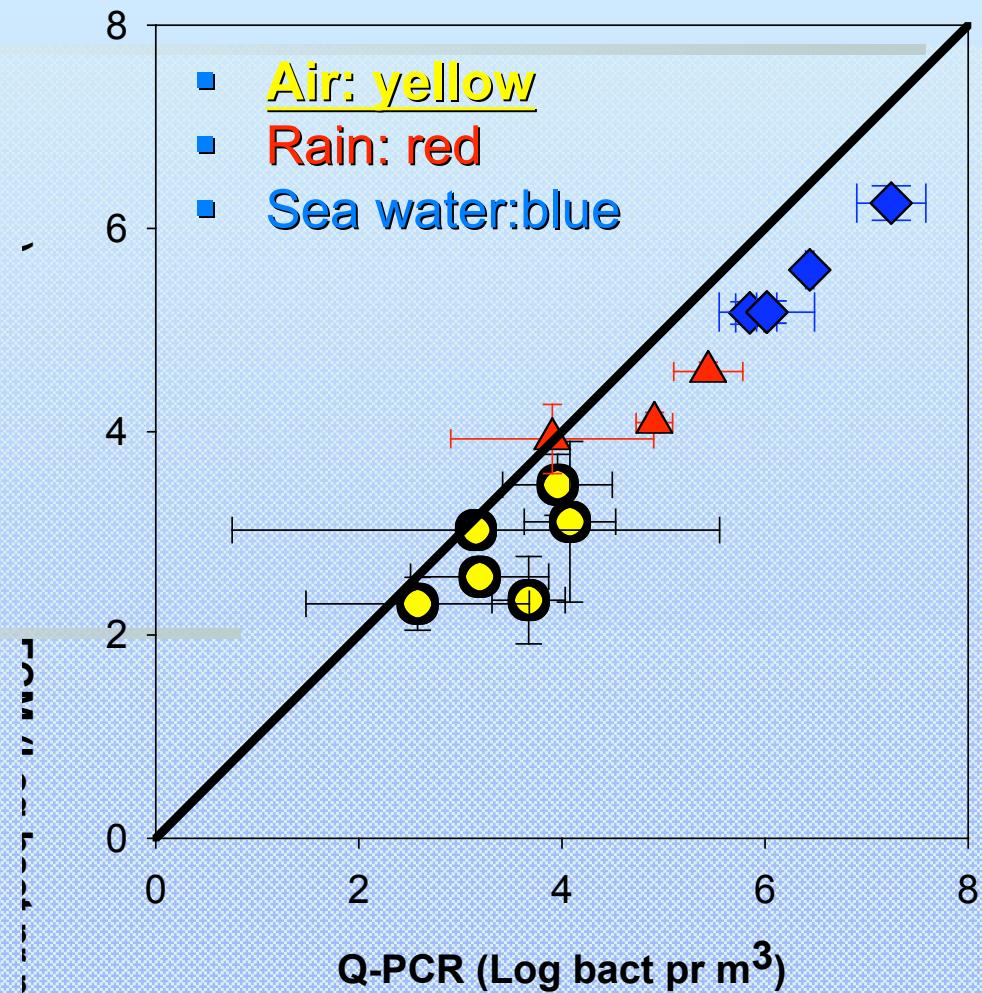

Flow cytometry of air samples

Flow cytometry vs Q-PCR

- Q-PCR:FCM ~10
- Calibration going on!

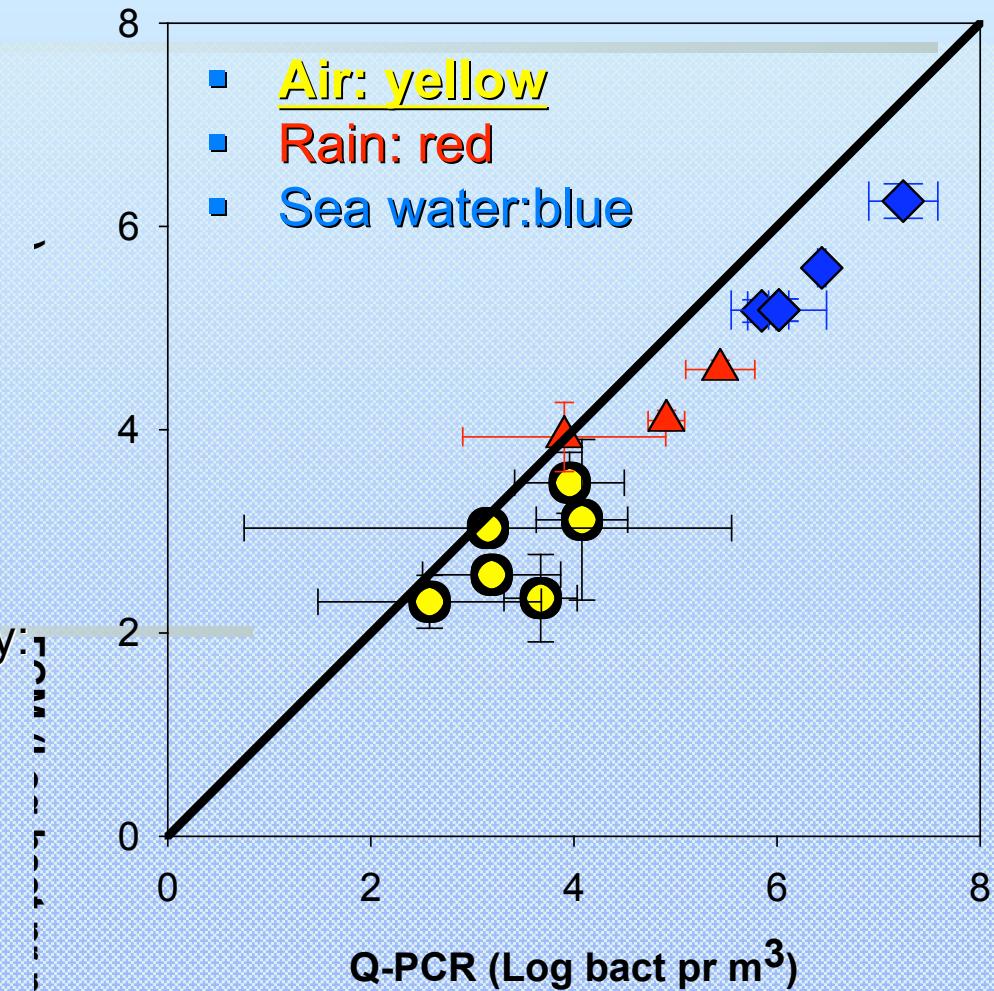

Flow cytometry vs Q-PCR

- Q-PCR:FCM ~10
- Calibration going on!

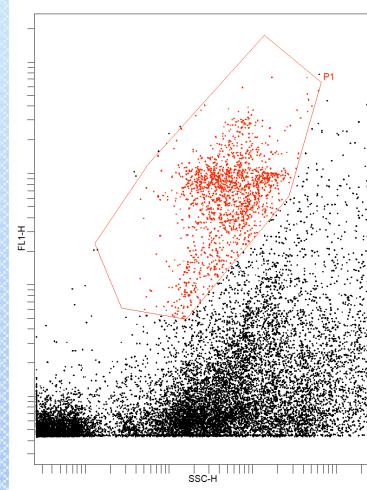

CFU: around 1-2% compared to FCM

Epifluorescence microscopy: difficult to discriminate signal/noise

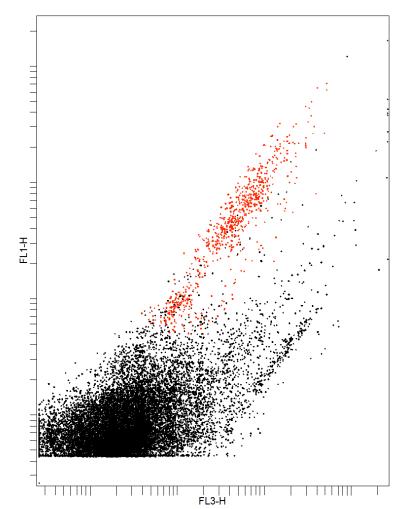

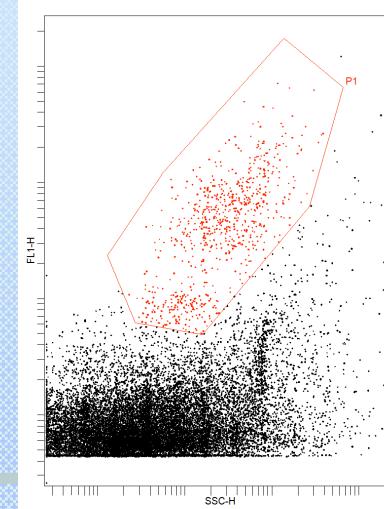

Snow and rain samples

snow $\sim 500 \cdot 10^4$ pr mL

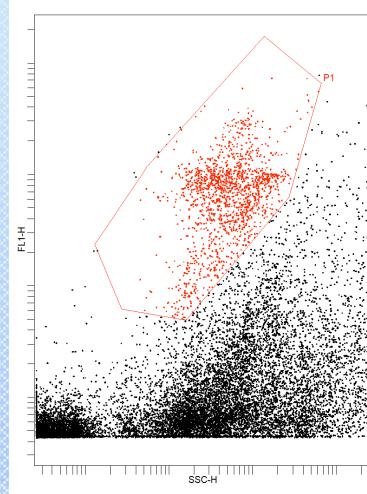

Rain $\sim 10^4$ pr mL

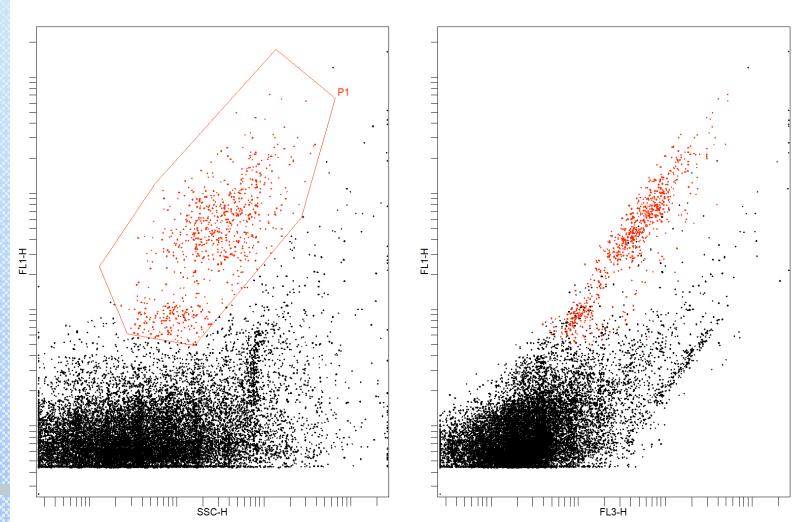

Snow and rain samples

snow $\sim 500 \cdot 10^4$ pr mL

Rain $\sim 10^4$ pr mL

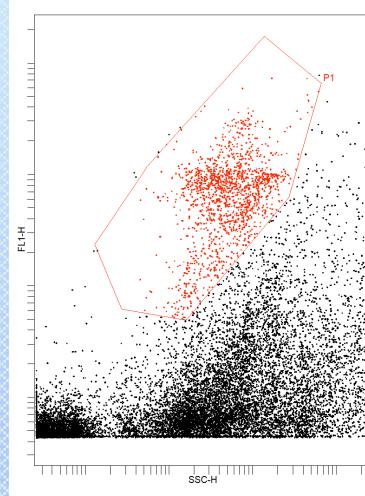

Bacterial production:

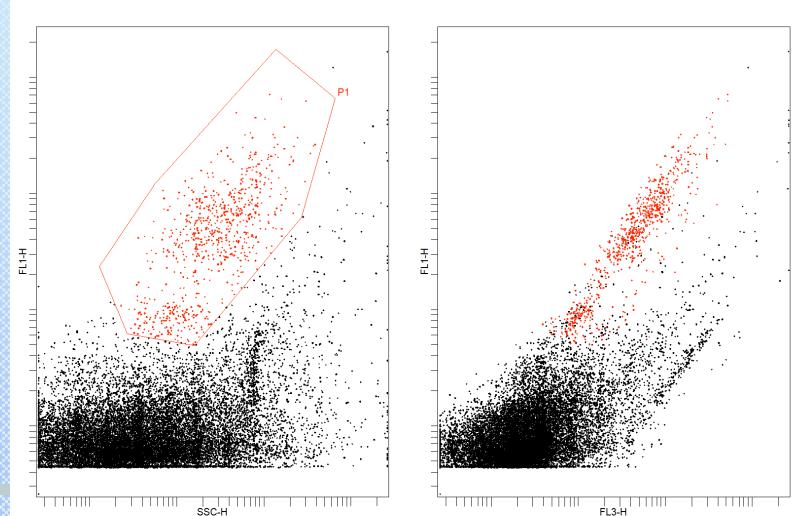

Addition of H^3 leucine, 24 h incubation

Snow and rain samples

snow $\sim 500 \cdot 10^4$ pr mL

Rain $\sim 10^4$ pr mL

Bacterial production:

Addition of H^3 leucine, 24 h incubation

Result: activity pr bacteria \sim as in sea water

Estimated generation time \sim 1 day

Comparison of 3 bioaerosol samplers

- Time series
- FCM and CFU counts
- Liquid loss rates

Sampler 1

■ Xmx-cv (Dycor)

- $0,7 \text{ m}^3 \text{ min}^{-1}$
- 5 mL
- Suggested max sampling time: 5 min
- Our sampling time 0-10 min
- Liquid: PBS
- ~10% PBS loss after 10 min

Sampler 2

- **SKC 225-9595 (SKC)**

- 0,0125 m³ min⁻¹
- Sampling time 0-60 min
- Liquid: MilliQ
- Refill~25% milliQ at 10 min

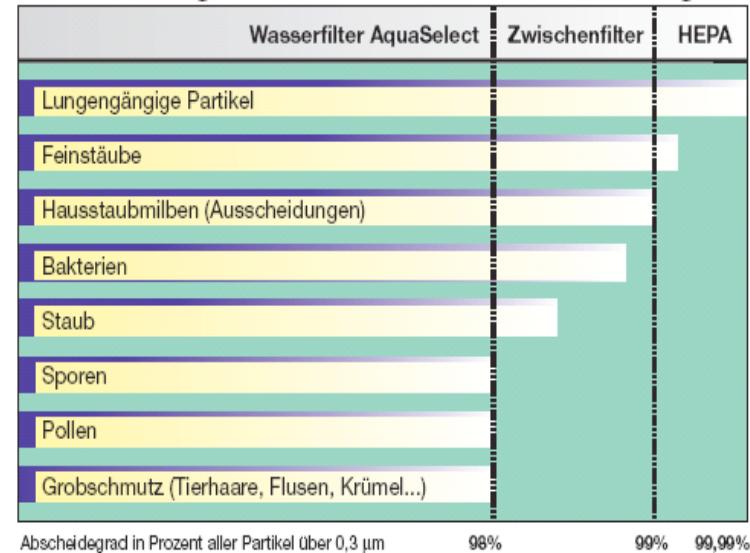

Sampler 3

■ Kärcher DS 5550

Die Wirkung des Kärcher Wasserfiltersaugers

Sampler 3

■ Kärcher DS 5550

- $3,3 \text{ m}^3 \text{ min}^{-1}$
- 1500 mL
- Max sampling time: 120 min
- Liquid: PBS
- ~10% pbs loss after 120 min

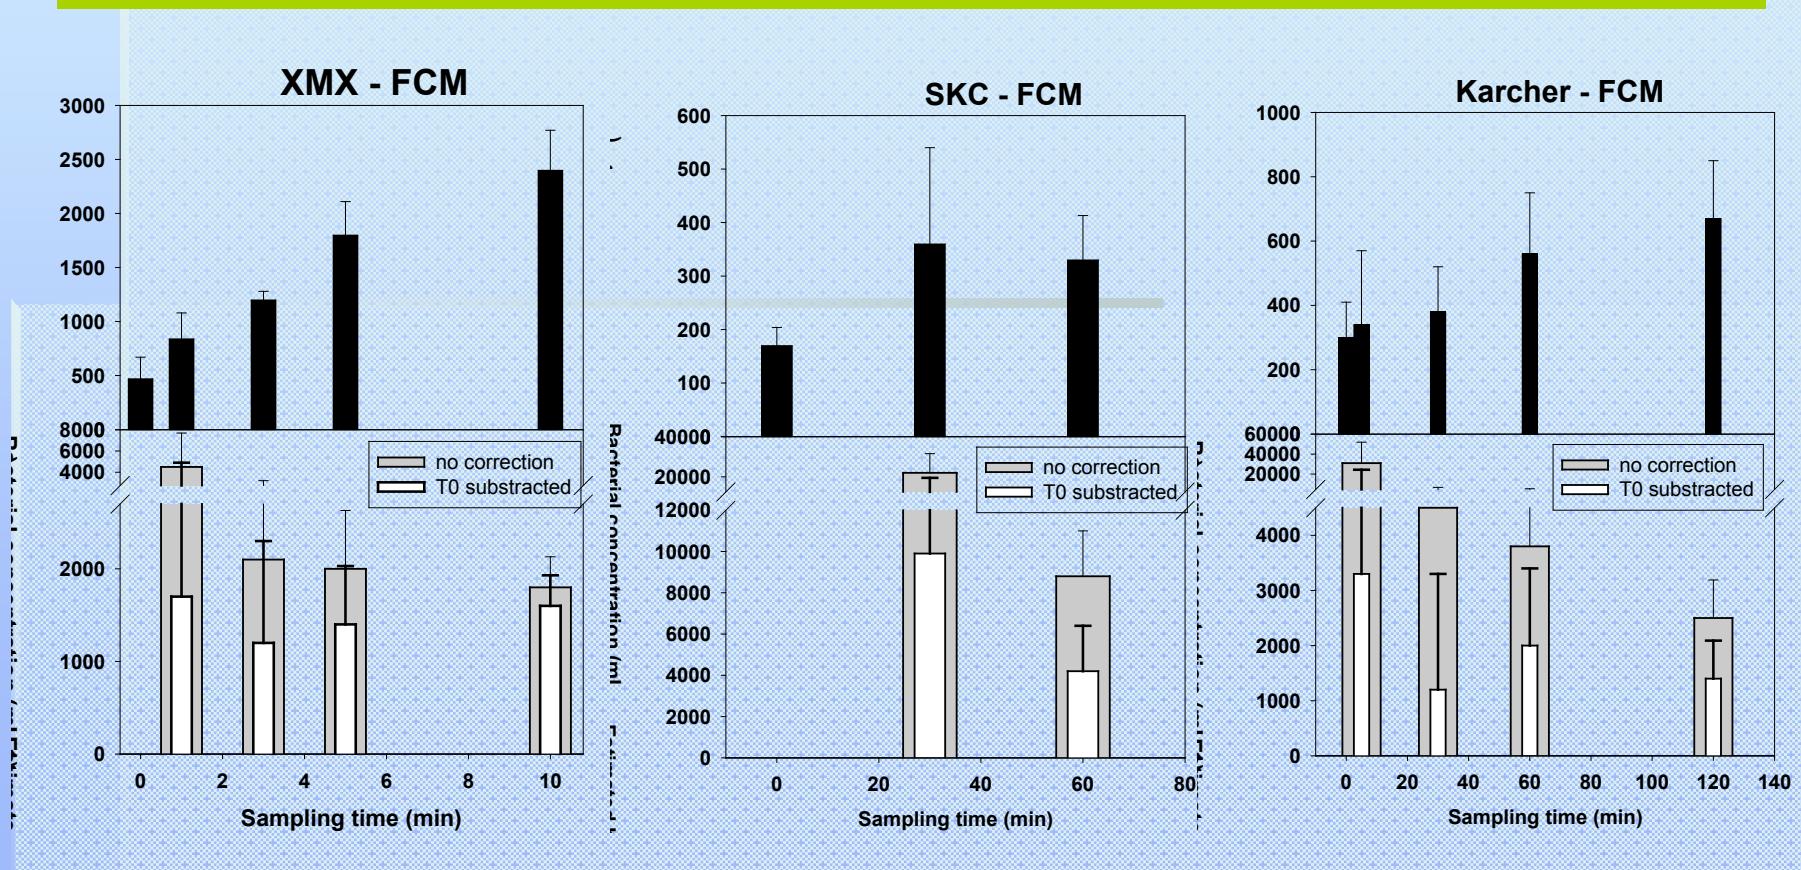

FCM counts - time series

Black: direct counts FCM "bacteria pr mL"

Grey: estimated bacterial concentration pr m^3 air

White: estimated bacterial conc pr m^3 air after subtracting blank (T0 sample)

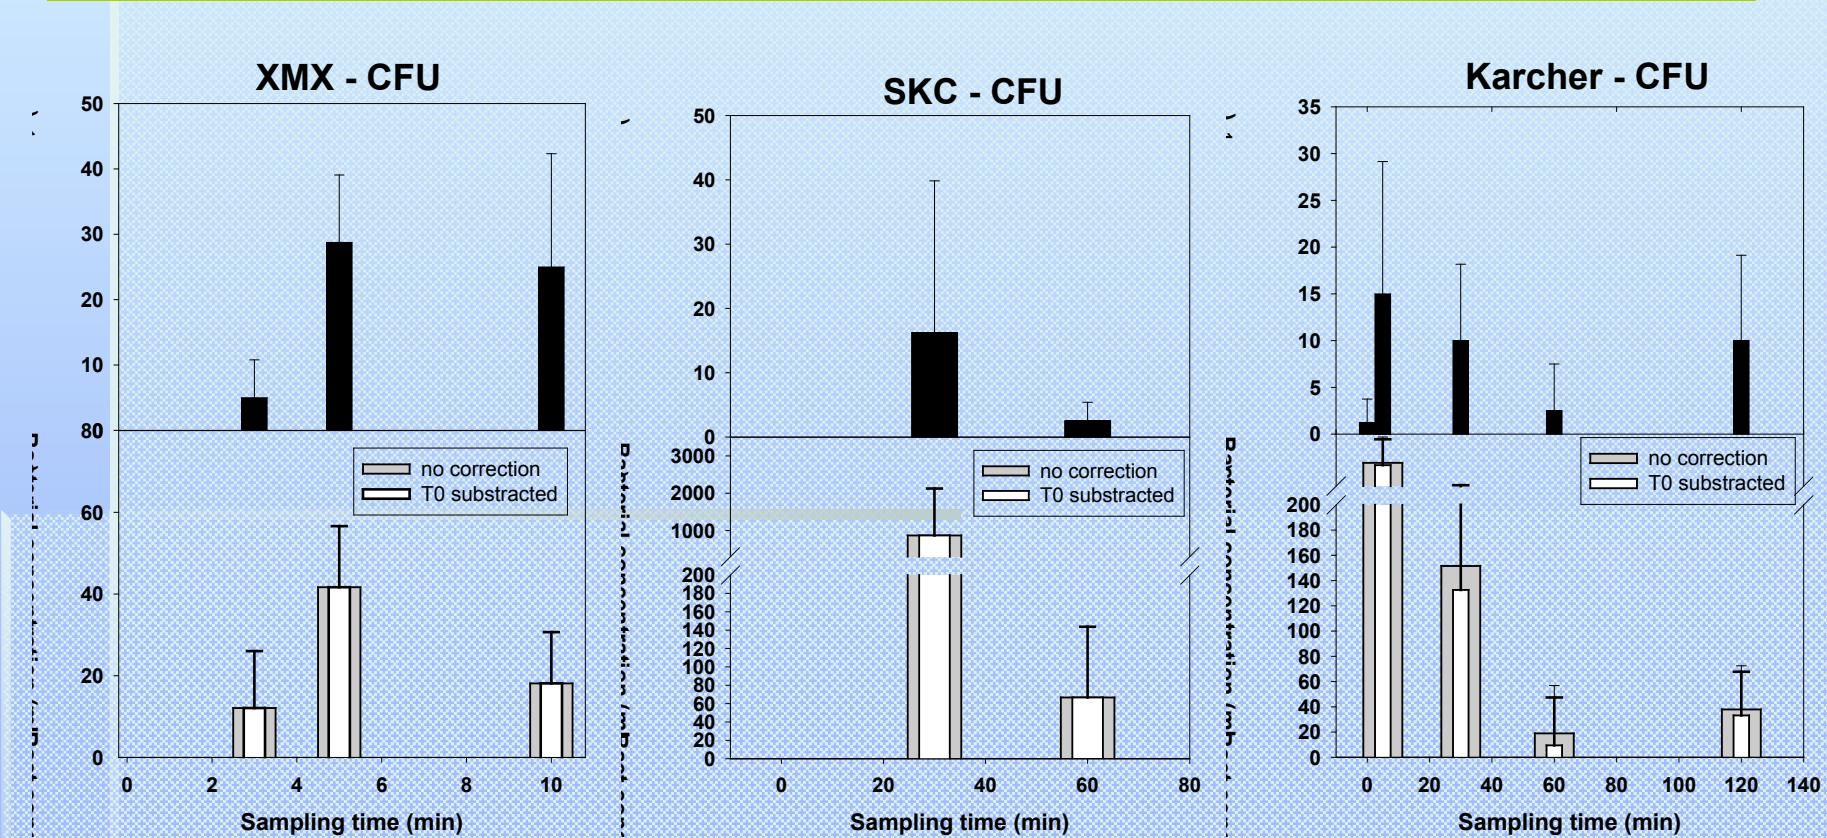

CFU counts - time

series

Black: direct counts CFM "bacteria pr mL"

Grey: estimated bacterial concentration pr m^3 air

White: estimated bacterial conc pr m^3 air after subtracting blank (T0 sample)

CFU as % of FCM

Sampler	sampling data		CFU pr m ³		FCM m ³		CFU as % of FCM

SKC

Kärcher

- + Robust
- + Low background
- + Fast sampling
- Low liquid volume

- + ok background
- Very low efficiency
- Highest liquid loss rate

- + High volume rates
- + High volumes
- High volumes
- Highest background

In the end

- **Bacteria in air pr m³:**
 - CFU 10-50
 - FCM ~10³

In the end

- **Bacteria in air pr m³:**

- CFU 10-50
 - FCM ~10³

- **Bacteria in snow/rain pr mL:**

- CFU 10-200

- FCM ~10⁴

- **Bacterial activity in snow/rain ~ SW bacteria**

In the end

- Bacteria in air pr m³:

- CFU 10-50
- FCM ~10³

Sampler test:

1. XMX-CV
2. Kärcher
3. SKC

- Bacteria in snow/rain pr mL:

- CFU 10-200
- FCM ~10⁴
- Bacterial activity in snow/rain ~ SW bacteria

In the end

- Bacteria in air pr m³:
 - CFU 10-50
 - FCM $\sim 10^3$
- Bacteria in snow/rain pr mL:
 - CFU 10-200
 - FCM $\sim 10^4$
- Bacterial activity in snow/rain ~ SW bacteria

Sampler test:

1. XMX-CV
2. Kärcher
3. SKC
